

A dynamic splash of water against a solid blue background, with several droplets and a large, central, rounded splash.

# At the cutting edge of hydroethics

Join the movement of efficient, sustainable solutions that meet your customers' industrial objectives.

Without water, industry would grind to a halt. Every year, 200 trillion gallons of industrial water is used around the world. **There is an urgent need to help industries get their water consumption under control.**

## Taking action for ethical water performance

Our “hydroethical” approach aims to reconcile industrial performance, energy efficiency and environmental footprints, by offering reliable and effective alternatives to traditional petrochemical solutions.

## A new paradigm

Rather than selling our products by the pound, ODYSSEE Environnement guarantees performance results while offering our clients comprehensive solutions capable of shrinking their footprints (water, environmental, energy and carbon).

## Together, we can achieve your goals while conserving water

ODYSSEE Environnement utilizes in-house innovations to enable our clients to reduce their environmental footprints without compromising on results:

We have just officially launched ODYLIFE, the first 100% biosourced scale-inhibiting agent, developed by our hydroethicists. This French creation achieves the same results as traditional solutions, at equivalent doses, with an 85% lower impact on the environment.

As a leader in film-forming amines for over 15 years, we have now released our 5<sup>th</sup>-generation product. This unique technology, designed to neutralize the corrosive properties of water, does not require the installation of any particular equipment and can reduce a steam boiler's gas consumption by 14%.
